Cypht

Cypht is a webmail client which was added to Tiki Wiki CMS Groupware version 20.x, and continued to improve in successive versions of Tiki, now at Tiki 26.x.

Cypht can be used with any standard mail server. In the context of WikiSuite, Virtualmin provides standard email accounts.

Here is the source code: https://github.com/cypht-org/cypht

Cypht is available as a standalone webmail client, and within Tiki, it gets additional features like calendaring (ex.: CalDAV). And over time, it will become feature-rich, as is the nature of Tiki's community and development model: Tiki is the Free / Libre / Open Source (FLOSS) Web application with the most built-in features. Please see https://dev.tiki.org/Email-as-a-first-class-citizen

Cypht has what you'd expect from a webmail client, and some very interesting features like aggregating email from multiple accounts.

Here is how Cypht is different: Webmail and groupware comparison

	Protect your account
	When using internet services, you deserve more choices and control. To get the best experience, we strongly encourage you to set up these account protections:

- Two-factor verification (2FA) increases your security. Use it with an authenticator app, security device (U2F, Yubikey, or OTP), or get a code sent to your phone. Set up 2FA.
- Aliases, alternate email addresses, give you control over who knows the real you. Use it to secure your account by making it harder to match a compromised password with your true email. Create aliases.

SMTP access - which most do.

Key Features

- Combined inbox, unread, sent, and flagged message views for all your E-mail accounts (and RSS feeds), as well as standard E-mail client folder navigation
- Flexible profiles to combined IMAP accounts with SMTP accounts and setup signatures and reply to details
- Compose messages in plain text, HTML, or Markdown (markdown formatted messages are converted to HTML before being sent)

- Search all your E-mail accounts and RSS feeds at once with a simple form
- Simple interface translation system that does not use gettext or .po files, just arrays of translated strings defined in PHP. Right to left languages are supported.
- Module sets for IMAP, SMTP, LDAP or local contacts, WordPress, Github, and lots more! Check out the Modules page for a complete list.

- Sessions and user data can be stored in any PDO compatible database or flat files on the server
- Authentication is flexible and currently supports IMAP, LDAP, an included database schema, dynamic authentication using popular E-mail providers, autodiscovery based on the user's E-mail domain, or you can roll your own with the site module set
- Sessions and Authentication can be customized without breaking any modules using the site module set
