Forgejo

Forgejo is a free and open-source, self-hosted software forge. It handles Git hosting, code review, issue tracking, CI/CD and package hosting. It is lightweight, easy to run and governed by its community.

For a live demo, check out https://next.forgejo.org/ (the project's public test instance).

Here is the source code: https://codeberg.org/forgejo/forgejo

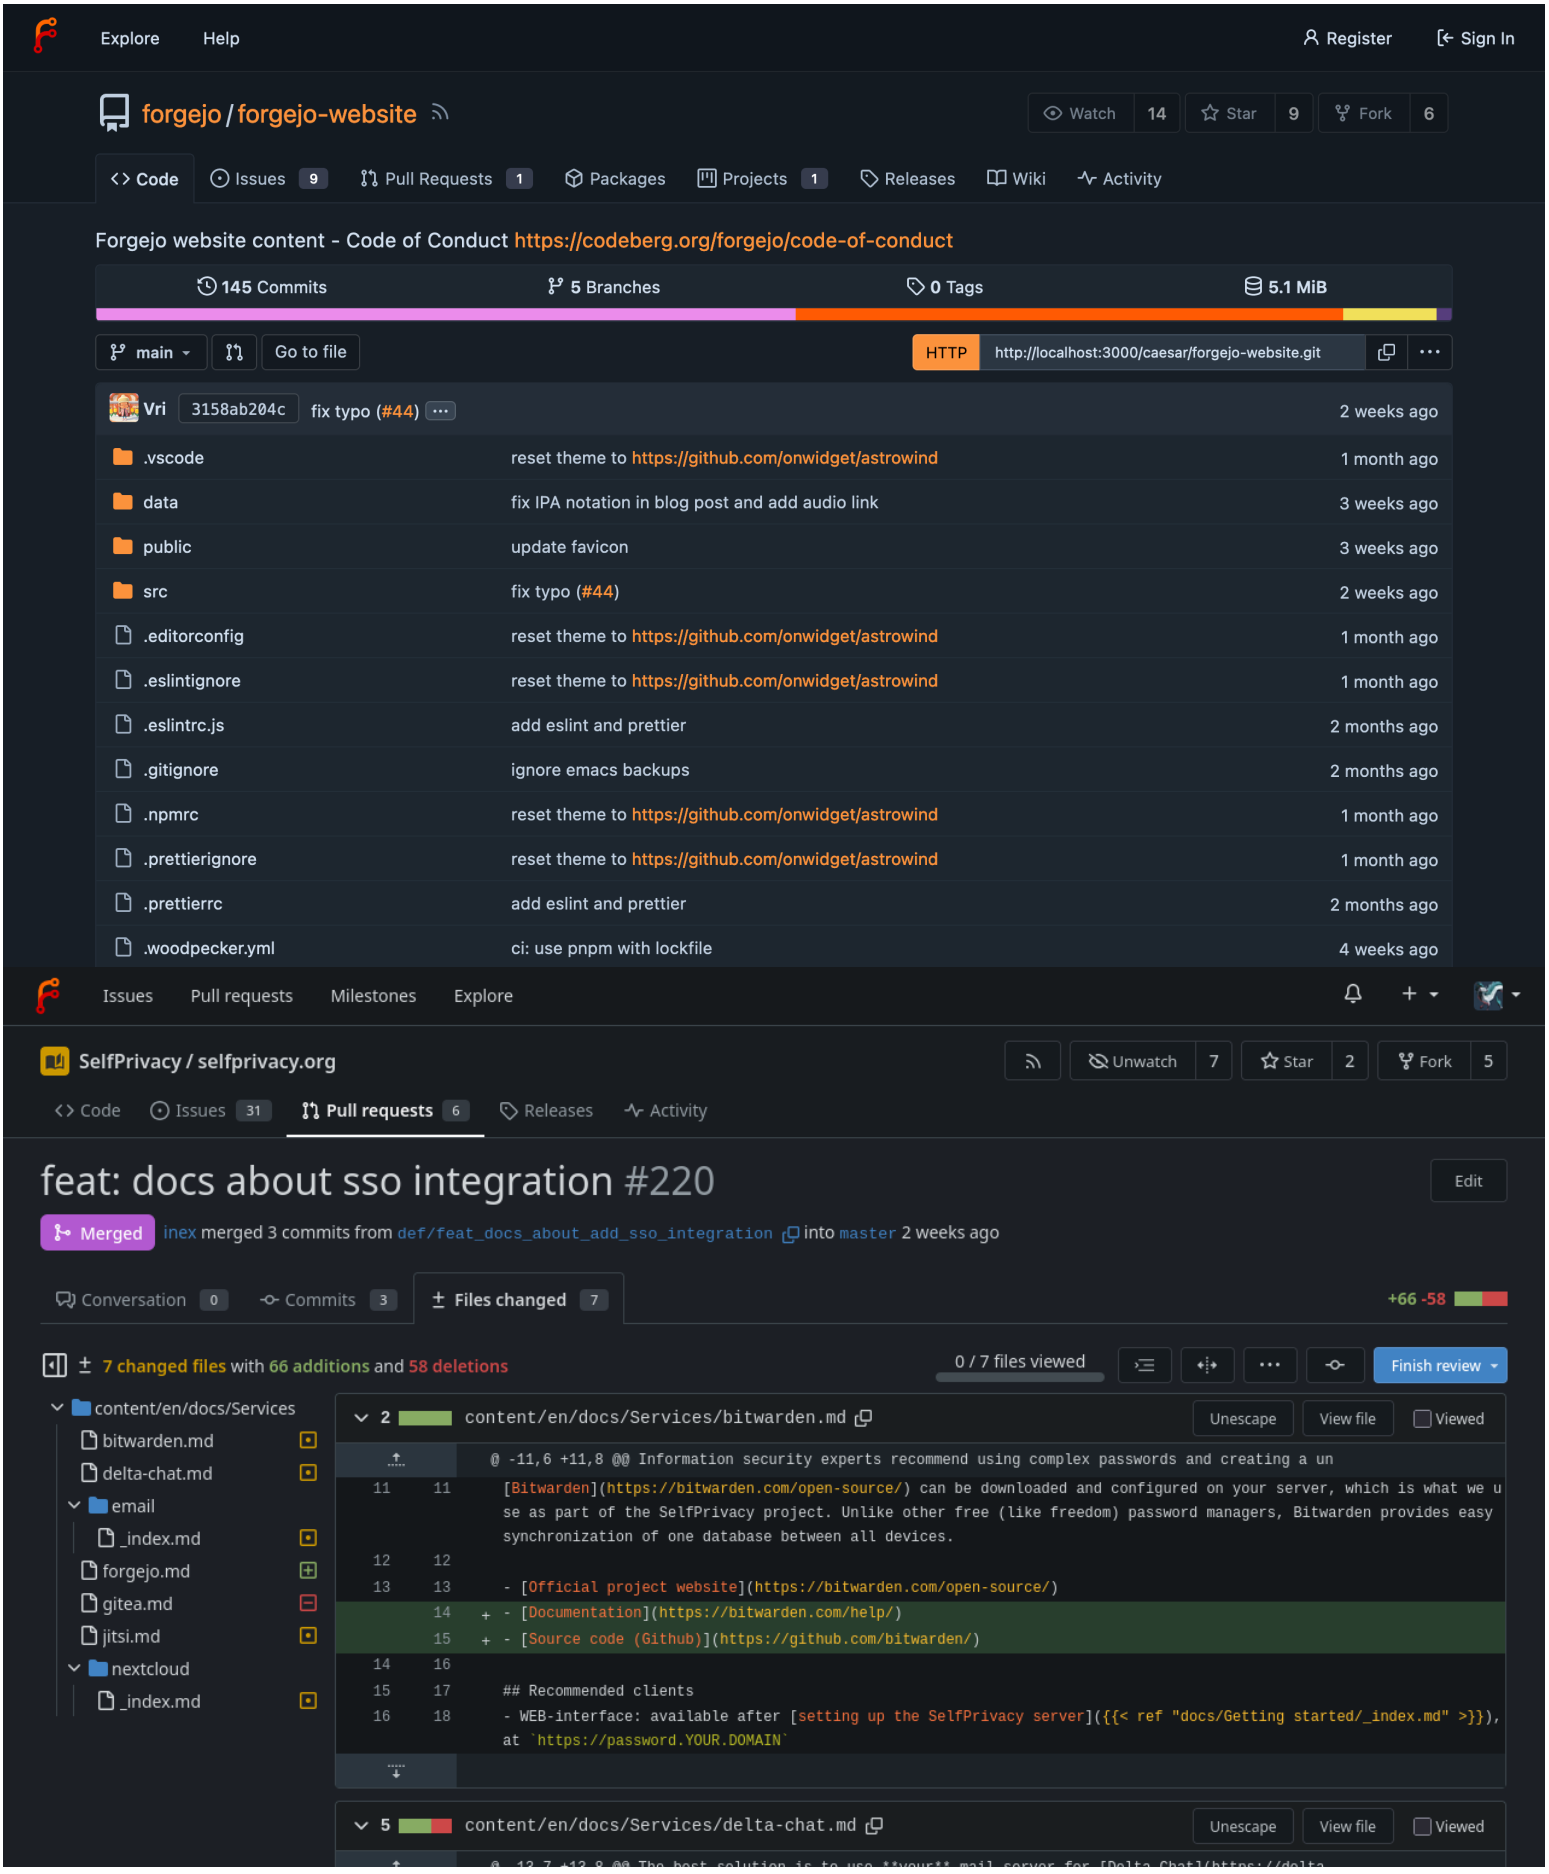

Forgejo is released under the GNU General Public License v3 or later (GPLv3+).

It can be self-hosted, so your code, issues and documentation all stay on infrastructure you control within your setup.

Key Features

- Git repository hosting with a web interface, branch protection and mirroring
- Pull requests with inline code review
- Issue tracking with labels, milestones and project (kanban) boards
- Forgejo Actions: built-in CI/CD, largely compatible with GitHub Actions workflows
- Package registry (Container/Docker, npm, PyPI, Maven, Composer and more)
- Built-in wiki and releases for every repository
- Migration tools for GitHub, GitLab, Gitea and others
- LDAP, OAuth2/OpenID Connect and two-factor authentication
- Federation in progress (ForgeFed / ActivityPub)

WikiSuite: The most comprehensive and integrated Open Source enterprise solution.

Forgejo started in late 2022 as a community fork of Gitea, created after control of Gitea moved to a for-profit company. It is hosted under the umbrella of Codeberg e.V., a non-profit organization based in Germany. In early 2024 Forgejo became a hard fork with its own development path. In 2024 (v9.0) it moved from the MIT license to GPLv3+ to keep it free software. A new major version comes out every three months, and one Long Term Support (LTS) release is made each year.
