How to set domain name on ClearOS

2021-07-20: WikiSuite will now support all major Linux distros. Thus, the information below is no longer updated. It may still be valid, or not. It will be eventually removed from this site, so anything relevant should be moved to the appropriate site. For anything related to ClearOS, please search among the following: ClearOS site, code base, Developer docs, Wiki or forum.

Please contact us if you would like to help out.

Configuration (Wizard step 2)

After the installation, you can set your domain name at https://example.org:81/app/network

Set the Internet domain name in ClearOS during the initial wizard

Set the server Hostname in ClearOS during the initial wizard
Set the Date, Time and Time Zone in ClearOS during the initial wizard

**Hostname**

It is time to define the hostname for your system. Hey, wait a minute... why do you need two hostnames? Often, these two hostnames are the same, but please read the help section for more information.

**Internet Hostname**

The internet hostname is the name of your system if accessed from the internet. Continuing our file server example, there may be a public web folder available for downloading files. The internet hostname could be set to fileserver.example.com.
Set up your domain name
