

Openfire

Started in 2002, **Openfire** is a real-time communication server implementing the XMPP (Jabber) and WebRTC protocols with a SIP gateway. It offers a very large number of features and a great admin panel and source code is available under the Apache 2.0 license. It includes [Jitsi Meet](#) and [Converse](#), and interacts with [Pàdé](#). The Openfire Fastpath Plugin adds support for managed queued chat requests, such as a support team might use. For example, a web based "Live Support" interface can point a potential customer at a workgroup representing the Sales team. Members of that workgroup will receive notification that a someone is waiting and when someone from that workgroup accepts, the customer and the team member will be connected to communicate with each other. See also [Why Openfire](#).

Openfire 3.10.0 Alpha

Built by [Jive Software](#) and the [IgniteRealtime.org](#) community

Email Settings

Use the form below to set the host and port of your email server (SMTP). At a minimum you should set the host and optionally you can set the port, username and password and whether or not to connect over SSL. If you have problems sending email please check the SMTP configuration on your mail server. Note, if you choose to enable mail debugging the debug output will be written to your appserver's standard out log.

SMTP Settings

Mail Host:

Server Port (Optional):

Mail Debugging: On Off (may require appserver restart)

Server Username (Optional):

Server Password (Optional):

Use SSL (Optional):

Key Features

Full standard XMPP feature set

- Presence
- Store and send offline messages
- Server to server messages
- XEP-0136: Message Archiving
- Multi-device
- XEP-280 message carbons
- File transfer

WebRTC videoconference

- Web chat interface
- Screen sharing
- Active speaker identification

General

- Encryption (done by clients)

WikiSuite: The most comprehensive and integrated Open Source enterprise solution.

- Runs on standard GNU/Linux server (and even Windows)
- OpenLDAP user integration available
- Some users can be in a browser and others with an XMPP client
- Web-based admin panel

Other

- Meeting planner (email notifications of upcoming meetings)
- [Fastpath](#) (managed queued chat requests, such as a support team might use)
- PDF Presentations via [PDF.js](#)
- Collaborative drawing (whiteboard) (Alpha)
- Collaborative text editing (Alpha)
- Co-Browsing (Alpha)
- SIP integration: Phone-in & call out phone numbers to the conference (Alpha)
- Recording a conference (Beta)
- Remote Control of keyboard and mouse (Alpha)
- Copy-Paste (Alpha)

Jitsi Meet vs Openfire Meetings

"Although jitmeet [Jitsi Meet](#) and ofmeet (Openfire Meetings) look similar, they are different underneath and are heading in different directions. Jitsi Meet is for generic XMPP servers and aimed at public internet facing conferencing using services like [prezi.org](#) and [etherpad.org](#) while Openfire Meetings is for private in-house conferencing where all collaboration applications are integrated into Openfire. For example, Ofmeet uses a PDF viewer which supports in-house corporate powerpoint presentations, while Jitmeet uses [prezi.org](#)."
