Prosody

Prosody is a lightweight and flexible **XMPP server** written in Lua. First released in **2008**, Prosody provides the backbone for **real-time communication**, including instant messaging, presence, and group chat, using the open **XMPP (Extensible Messaging and Presence Protocol)** standard.

Designed for both **simplicity and performance**, Prosody is easy to configure, secure, and highly extensible through a wide range of community modules. The project is released under the **MIT License**.

Within **WikiSuite**, Prosody can provide **chat**, **presence**, and **real-time collaboration** services for users. With appropriate configuration (for example using Tiki's Prosody integration module or userlist bridge), it can be linked to **Tiki** for unified user management and authentication.
