  (2025-05-23)
  Can't we only allow run detect command as root, and other command can remain as it is?

- [SoftStart Code pushed to project branch master at WikiSuite / Virtualmin Tiki Manager](#)   (2025-05-22)
  SoftStart Code (4575bbfd) at 21 May 08:09 Merge branch 'item130775-virtualmin-fix-log-write-permission' into
  ... ... and 1 more commit

- [SoftStart Code accepted merge request !63: [FIX] Run Global Tiki Manager CLI as Root to Avoid Log Write
  Permission Issues in Virtualmin at WikiSuite / Virtua...](#)   (2025-05-22)
  This MR fixes the issue where running tiki-manager under Virtualmin fails with log permission errors due to user
  switching. Tiki Manager, in its current state expects to be executed always with the user who has permissions in
  the Tiki Manager folder, so switching to the domain user causes Tiki Manager to fail due to permission issues.
  There is a work in progress to allow Tiki-Manager to execute some operations as other users, but it is still not
  merged. That would allow some commands to be executed impersonating the domain user in the future. Ref:

  int... ... and 1 more commit

- [SoftStart Code accepted merge request !64: [ENH] Skip Remaining Configuration Steps on Instance Creation
  Failure at WikiSuite / Virtualmin Tiki Manager](#)   (2025-05-22)
  Context: Enhances stability by ensuring that no additional configuration steps (e.g., setting preferences,
  changing ownership) are run if instance creation fails via Tiki Manager. Changes:
  tikimanager_tiki_install_and_config now checks for ERROR string in the output of tikimanager_tiki_install(). If an
  error is detected, the process logs a message and skips remaining steps gracefully. Ref:
  https://avan.tech/item131133

WikiSuite: The most comprehensive and integrated Open Source enterprise solution.

- [Sandeep D closed merge request !62: [Fix] Run Global Tiki Manager CLI as Root to Avoid Log Write Permission Issues in Virtualmin at WikiSuite / Virtualmin Ti...](#)   (2025-05-21)
  This merge request addresses a permission error occurring when Tiki Manager CLI operations are executed under the domain user in Virtualmin environments. Root Cause: The tikimanager_execute_command() function runs the global Tiki Manager CLI using the domain user context. This leads to failures writing logs such as: [ERROR] The stream or file "/opt/tiki-manager/app/logs/trim-YYYY-MM-DD.output" could not be opened in append mode: Failed to open stream: Permission denied Solution: Updated tikimanager_execute_command() to conditionally revert the user switch and execute the command as root. Ref: https://avan.tech/item130775
