Virtualmin vs YunoHost

YunoHost and Virtualmin have some similarities. This page is to explain the differences and rationale of choices.

Similarities

- Both are FLOSS platforms that facilitate self-hosting
- Both are well supported platforms
- Both offer email management
- Tiki Wiki CMS groupware is supported in both.

Differences

- Virtualmin is focused on being a platform for shared hosting (where each client has a distinct space). whereas YunoHost is first and foremost an app installer, and there are various levels of integrations.
- YunoHost supports only Debian, whereas Virtualmin supports many distros (Debian, Ubuntu, Rocky Linux, etc.)
- There is just one edition of YunoHost, whereas there is Virtualmin GPL and Virtualmin Pro (Paid).
- YunoHost offers tons of applications for free, whereas Virtualmin GPL offers a small number. You need to get Virtualmin Pro to get a large number.
- YunoHost is in Python, whereas Virtualmin is in Perl
- YunoHost has out of the box support for XMPP
