

Cypht

Cypht is a webmail client which was added to [Tiki Wiki CMS Groupware](#) version [20.x](#), and continued to improve in successive versions of Tiki, now at [Tiki 26.x](#).

Cypht can be used with any standard mail server. In the context of WikiSuite, [Virtualmin](#) provides standard email accounts.

Here is the source code: <https://github.com/cypht-org/cypht>

Cypht is available as a standalone webmail client, and within Tiki, it gets additional features like calendaring (ex.: CalDAV). And over time, it will become feature-rich, as is the nature of Tiki's community and development model: [Tiki is the Free / Libre / Open Source \(FLOSS\) Web application with the most built-in features](#). Please see <https://dev.tiki.org/Email-as-a-first-class-citizen>

Cypht has what you'd expect from a webmail client, and some very interesting features like [aggregating email from multiple accounts](#).

Here is how Cypht is different: [Webmail and groupware comparison](#)

Protect your account

When using internet services, you deserve more choices and control.

To get the best experience, we strongly encourage you to set up these account protections:

Two-factor verification (2FA) increases your security. Use it with an authenticator app, security device (U2F, Yubikey, or OTP), or get a code sent to your phone. [Set up 2FA](#).

Aliases, alternate email addresses, give you control over who knows the real you. Use it to secure your account by making it harder to match a compromised password with your true email. [Create aliases](#).

Help

Cypht is a webmail program. You can use it to access your E-mail accounts from any service that offers IMAP, POP3, or SMTP access - which most do.

Key Features

- Combined inbox, unread, sent, and flagged message views for all your E-mail accounts (and RSS feeds), as well as standard E-mail client folder navigation
- Flexible profiles to combined IMAP accounts with SMTP accounts and setup signatures and reply to details
- Compose messages in plain text, HTML, or Markdown (markdown formatted messages are converted to HTML before being sent)
- Search all your E-mail accounts and RSS feeds at once with a simple form
- Simple interface translation system that does not use gettext or .po files, just arrays of translated strings defined in PHP. Right to left languages are supported.
- Module sets for IMAP, SMTP, LDAP or local contacts, WordPress, Github, and lots more! Check out the Modules page for a complete list.
- Sessions and user data can be stored in any PDO compatible database or flat files on the server
- Authentication is flexible and currently supports IMAP, LDAP, an included database

schema, dynamic authentication using popular E-mail providers, auto-discovery based on the user's E-mail domain, or you can roll your own with the site module set

- Sessions and Authentication can be customized without breaking any modules using the site module set
