Description

Picking PHP Version for Crontab Scripts

Reported by

Area

ClearOS (deprecated)

Details

I've installed the latest version of the PHP Picker app on my clearOS 7.4 box. The server is hosting a web app that was written in Laravel. The web app has components that require PHP 7. Of those are some crontab scripts.

I know that the default PHP in clearOS is version 5.4 and am wondering how to pick PHP 7 for the crontabs?

Here is an example of the crontabs I want to run:

```
0 2 * * * php /var/www/virtual/lms.domain.com/artisan draft-clear:document > /var/log/lms/drafts_docs_cleaner.log
```

Thank you.

Yes, we noticed for Tiki as well. A fix has been found and will be proposed for the PHP engines app.

Marc Laporte 2018-01-23 22:51

<https://github.com/WikiSuite/app-php-engines/pull/4>

techana 2018-01-24 02:29

That's great. Let's now hope for PHP 7.1 since 7.0 is getting difficult to work with now 😊

Marc Laporte 2018-01-24 17:49

7.1 is coming for sure.

PHP 7.1 available:

[http://wikisuite.org/H
ow-to-install-a-PHP-
version-picker-on-
ClearOS](http://wikisuite.org/How-to-install-a-PHP-version-picker-on-ClearOS)

Marc Laporte 2018-02-10 17:54

@techana : app-php-engines 1.1.1-1 should use the PHP which is set for that website.
Please confirm.

techana 2018-02-10 18:24

Thank you.

Repo clearos-contribs-testing still shows app-php-engines.noarch
1:1.1.0-1.v7. I'll wait till the newer version propagates through my
repo's mirror then test.

Marc Laporte 2018-02-10 21:02

I did `yum --enablerepo=clearos-contribs-testing
install app-php-engines` and it worked.

techana 2018-02-11 15:09

I installed app-php-engines v.1.1.1 but it still uses PHP version 5.4.16
when running from a crontab.

How I tested it:

1. Chose PHP v.7.1 for a website.

2. Made a test PHP script in the document root of that website:

```
<?php  
echo 'Current PHP version: ' . phpversion();  
?>
```

3. Ran the above script from inside the website's document root. The
result was:

Current PHP version: 7.1.8

4. Put the script in a root's crontab:

- * * * * php
/var/flexshare/shares/test.domain.com/html/crontab_test.php >>
/tmp/crontab_test.log

5. The crontab_test.log is now containing:

Current PHP version: 5.4.16

Current PHP version: 5.4.16

Current PHP version: 5.4.16

Current PHP version: 5.4.16

...

Marc Laporte 2018-02-11 16:13

ok, maybe we need one more commit:

<https://github.com/WikiSuite/app-php-engines/pull/5>

Ricardo Melo 2018-02-11 16:36

Hi techana,

the way it work, it search for the version to use from the current working directory.

you should change your cron to cd first to the working directory, like:

```
* * * * * cd
/var/flexshare/shares/test.domain.com/ht
ml/ && php crontab_test.php >>
/tmp/crontab_test.log
```

Marc Laporte 2018-02-11 16:42

Good point Ricardo!

techana 2018-02-11 18:20

Unfortunately, this method did not work either. crontab_test.log still shows PHP ver. 5.4 is being used, not ver. 7.1

techana 2018-02-11 18:48

The only way I was able to make this to work is to run my crontab using the desired php engine directly, e.g. /opt/rh/rh-php71/root/usr/bin/php

In order to make things easier, I created symbolic links in /usr/bin, e.g.:
/usr/bin/php71-cli -> /opt/rh/rh-php71/root/usr/bin/php

Then, in the crontab, I use the desired engine to run the php script, e.g.:

```
* * * * * php71-cli  
/var/flexshare/shares/test.domain.com/html/crontab_test.php >>  
/tmp/crontab_test.log
```
