Description

Create ClearOS app for Openfire Meetings

Assigned to

guus.der.kinderen

Reported by

Marc Laporte

Priority

2

Area

Realtime (Openfire/Jitsi Meet)

ClearOS (deprecated)

Details

Let's transform this into a few clicks: [How to install Openfire Meetings on ClearOS](#)

Let's add subdomains to be able to avoid needing to open ports like 7443

First Openfire RPM available since 2016-12-23 (This will eventually replace the very long instructions at <http://wikisuite.org/How-to-install-Openfire-Meetings-on-ClearOS>)

WikiSuite: The most comprehensive and integrated Open Source enterprise solution.

Openfire can be installed with the following command on a ClearOS 7 box:

```
yum --enablerepo=clearos-contribs-testing install app-openfire
```

You may see an error on install - "fg: no job control". it's non-fatal and will be cleaned up. In the ClearOS menu, go to "Server - Communication and Collaboration - Openfire" in the menu. You can start/stop the service as well as find a link to the admin console.

Next steps: scope out what is required to simplify the wizard process (e.g. automatic database provisioning and LDAP settings).

The RPM spec file and systemd extras can be found on Github @ <https://github.com/WikiSuite/openfire>

The app is here: <https://github.com/WikiSuite/app-openfire>

2017-03-27 This is the second round of the Openfire RPM for ClearOS:

<http://wikisuite.org/How-to-install-Openfire-Meetings-on-ClearOS>

Marc Laporte 2018-04-23 02:51

The app is good now.

As of now: Openfire 4.2.3 / app-openfire 1.2.8
